TriCure Granular®

Benefits & Features

- Treats Localised Dry Spot & hydrophobic soil conditions
- Improves water infiltration via its unique capacity to both vertically and laterally move water throughout the soil and thatch layer
- Ensures uniform moisture distribution throughout the rootzone
- Effective in mineral soils, organic matter-rich soils andthatch layers
- Reduces the need for labour-intensive hand watering and spot watering
- Quality granular formulation for easy application using conventional spreaders
- Safe and non-phytotoxic

TriCure Granular is a unique granular soil surfactant developed to:

- Treat and prevent hydrophobic soil conditions
- Overcome hydrophobic organic layers including thatch
- Improve the movement and distribution of water throughout the soil profile
- Easy application using hand or fertiliser spreaders

The product features a block co-polymer surfactant technology formulated to reduce water repellency and improve the wetting of dry soils. It works by reducing the surface tension between water and hydrophobic soil particles, allowing irrigation and rainfall to infiltrate more effectively into the rootzone rather than running off or pooling on the surface.

The DG Lite granular carrier provides a convenient delivery system that releases the surfactant into the soil following irrigation, helping restore uniform moisture distribution and improving overall soil water availability.

By improving the movement and retention of water within the profile, **TriCure Granular** assists turf managers in maintaining healthier root systems, mitigating drought stress, and achieving more consistent playing surfaces.

Application Rates

Preventative/ Normal use	120kg/Ha or 1.2kg/100m^2
Curative/ High stress	150kg/Ha or 1.5kg/100m^2

Use Patterns

Begin applications when soil temperatures and environmental conditions favour the development of water repellency, typically when ambient temperatures exceed 22°C.

- For golf greens, tees and fairways, apply 120kg -150 kg per ha monthly or as required.
- Suitable for spot treatments, bunker surrounds, slopes, approaches, and other difficult-to-wet areas.
- Suitable for sports turf, lawns and landscapes to improve plant performance.
- TriCure Granular does not require immediate irrigation. However, always water-in after application for optimum performance.
